

Week 8 Thursday

L-14

Flux in flat atmospheres

(Solving for T , yah!)

We are here

Intensity for a flat, semi-infinite atmosphere

out

$$I(\tau_z, u > 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=\infty} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau_z}{u}$$

in

$$I(\tau_z, u < 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=0} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau_z}{u}$$

Reminder

Intensity for a flat, semi-infinite atmosphere

Reminder

out

$$I(\tau_z = 0, u > 0) = \int_{\tau'_z = \tau_z}^{\tau'_z = \infty} \boxed{S(\tau'_z)} e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau_z}{u}$$

in

$$I(\tau_z = 0, u < 0) = \int_{\tau'_z = \tau_z}^{\tau'_z = 0} \boxed{S(\tau'_z)} e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau_z}{u}$$

Means we can find $S(\tau)$ (and $T(z)$)

For the Sun, we can measure!

For other stars, our telescope cannot resolve their stellar disk
= we measure the surface flux.
So we cannot use limb-darkening to find $T(z)$

Reminder

Flux through a surface in a blackbody radiation field

Reminder

$$\begin{aligned}
 F_{\lambda\nu} &= 2\pi \int_{-\cancel{0}}^{+1} B_{\lambda\nu} u du \\
 &= 2\pi B_{\lambda\nu} \int_0^{+1} u du \\
 &= \pi B_{\lambda\nu} \\
 F_{\text{tot}} &= \pi \int_0^\infty B_{\lambda\nu} d\nu \\
 &= \pi \int_0^\infty \frac{2h}{c^2} \frac{\nu^3}{e^{h\nu/kT} - 1} d\nu \\
 &= \frac{2\pi^5 k^4}{15h^3 c^2} T^4 \\
 &= \sigma T^4
 \end{aligned}$$

The ‘effective’ temperature T_{eff}

The temperature of a BB that has the same surface (wavelength-integrated) flux as the star

Reminder

$$F_{\lambda\nu} = 2\pi \int_{-\infty}^{+\infty} B_{\lambda\nu} u du$$

$$= 2\pi B_{\lambda\nu} \int_0^{+1} u du$$

$$= \pi B_{\lambda\nu}$$

$$F_{\text{tot}} = \pi \int_0^{\infty} B_{\lambda\nu} d\nu$$

$$= \pi \int_0^{\infty} \frac{2h}{c^2} \frac{\nu^3}{e^{h\nu/kT} - 1} d\nu$$

$$= \frac{2\pi^5 k^4}{15h^3 c^2} T^4$$

$$= \sigma T^4$$

For the Sun: 63 MegaWatt / m² → For a BB to have 63 MegaWatt / m²

Thus T_{eff} for the sun is ~ 5700 K. ← T needs to be ~ 5700 K

Note: this does NOT mean that $F_{\lambda,\odot} = B_{\lambda}(T = 5700K)$

The (wavelength-integrated) flux is Power per area

If our atmosphere is “flat”

Flux through that surface = σT_{eff}^4

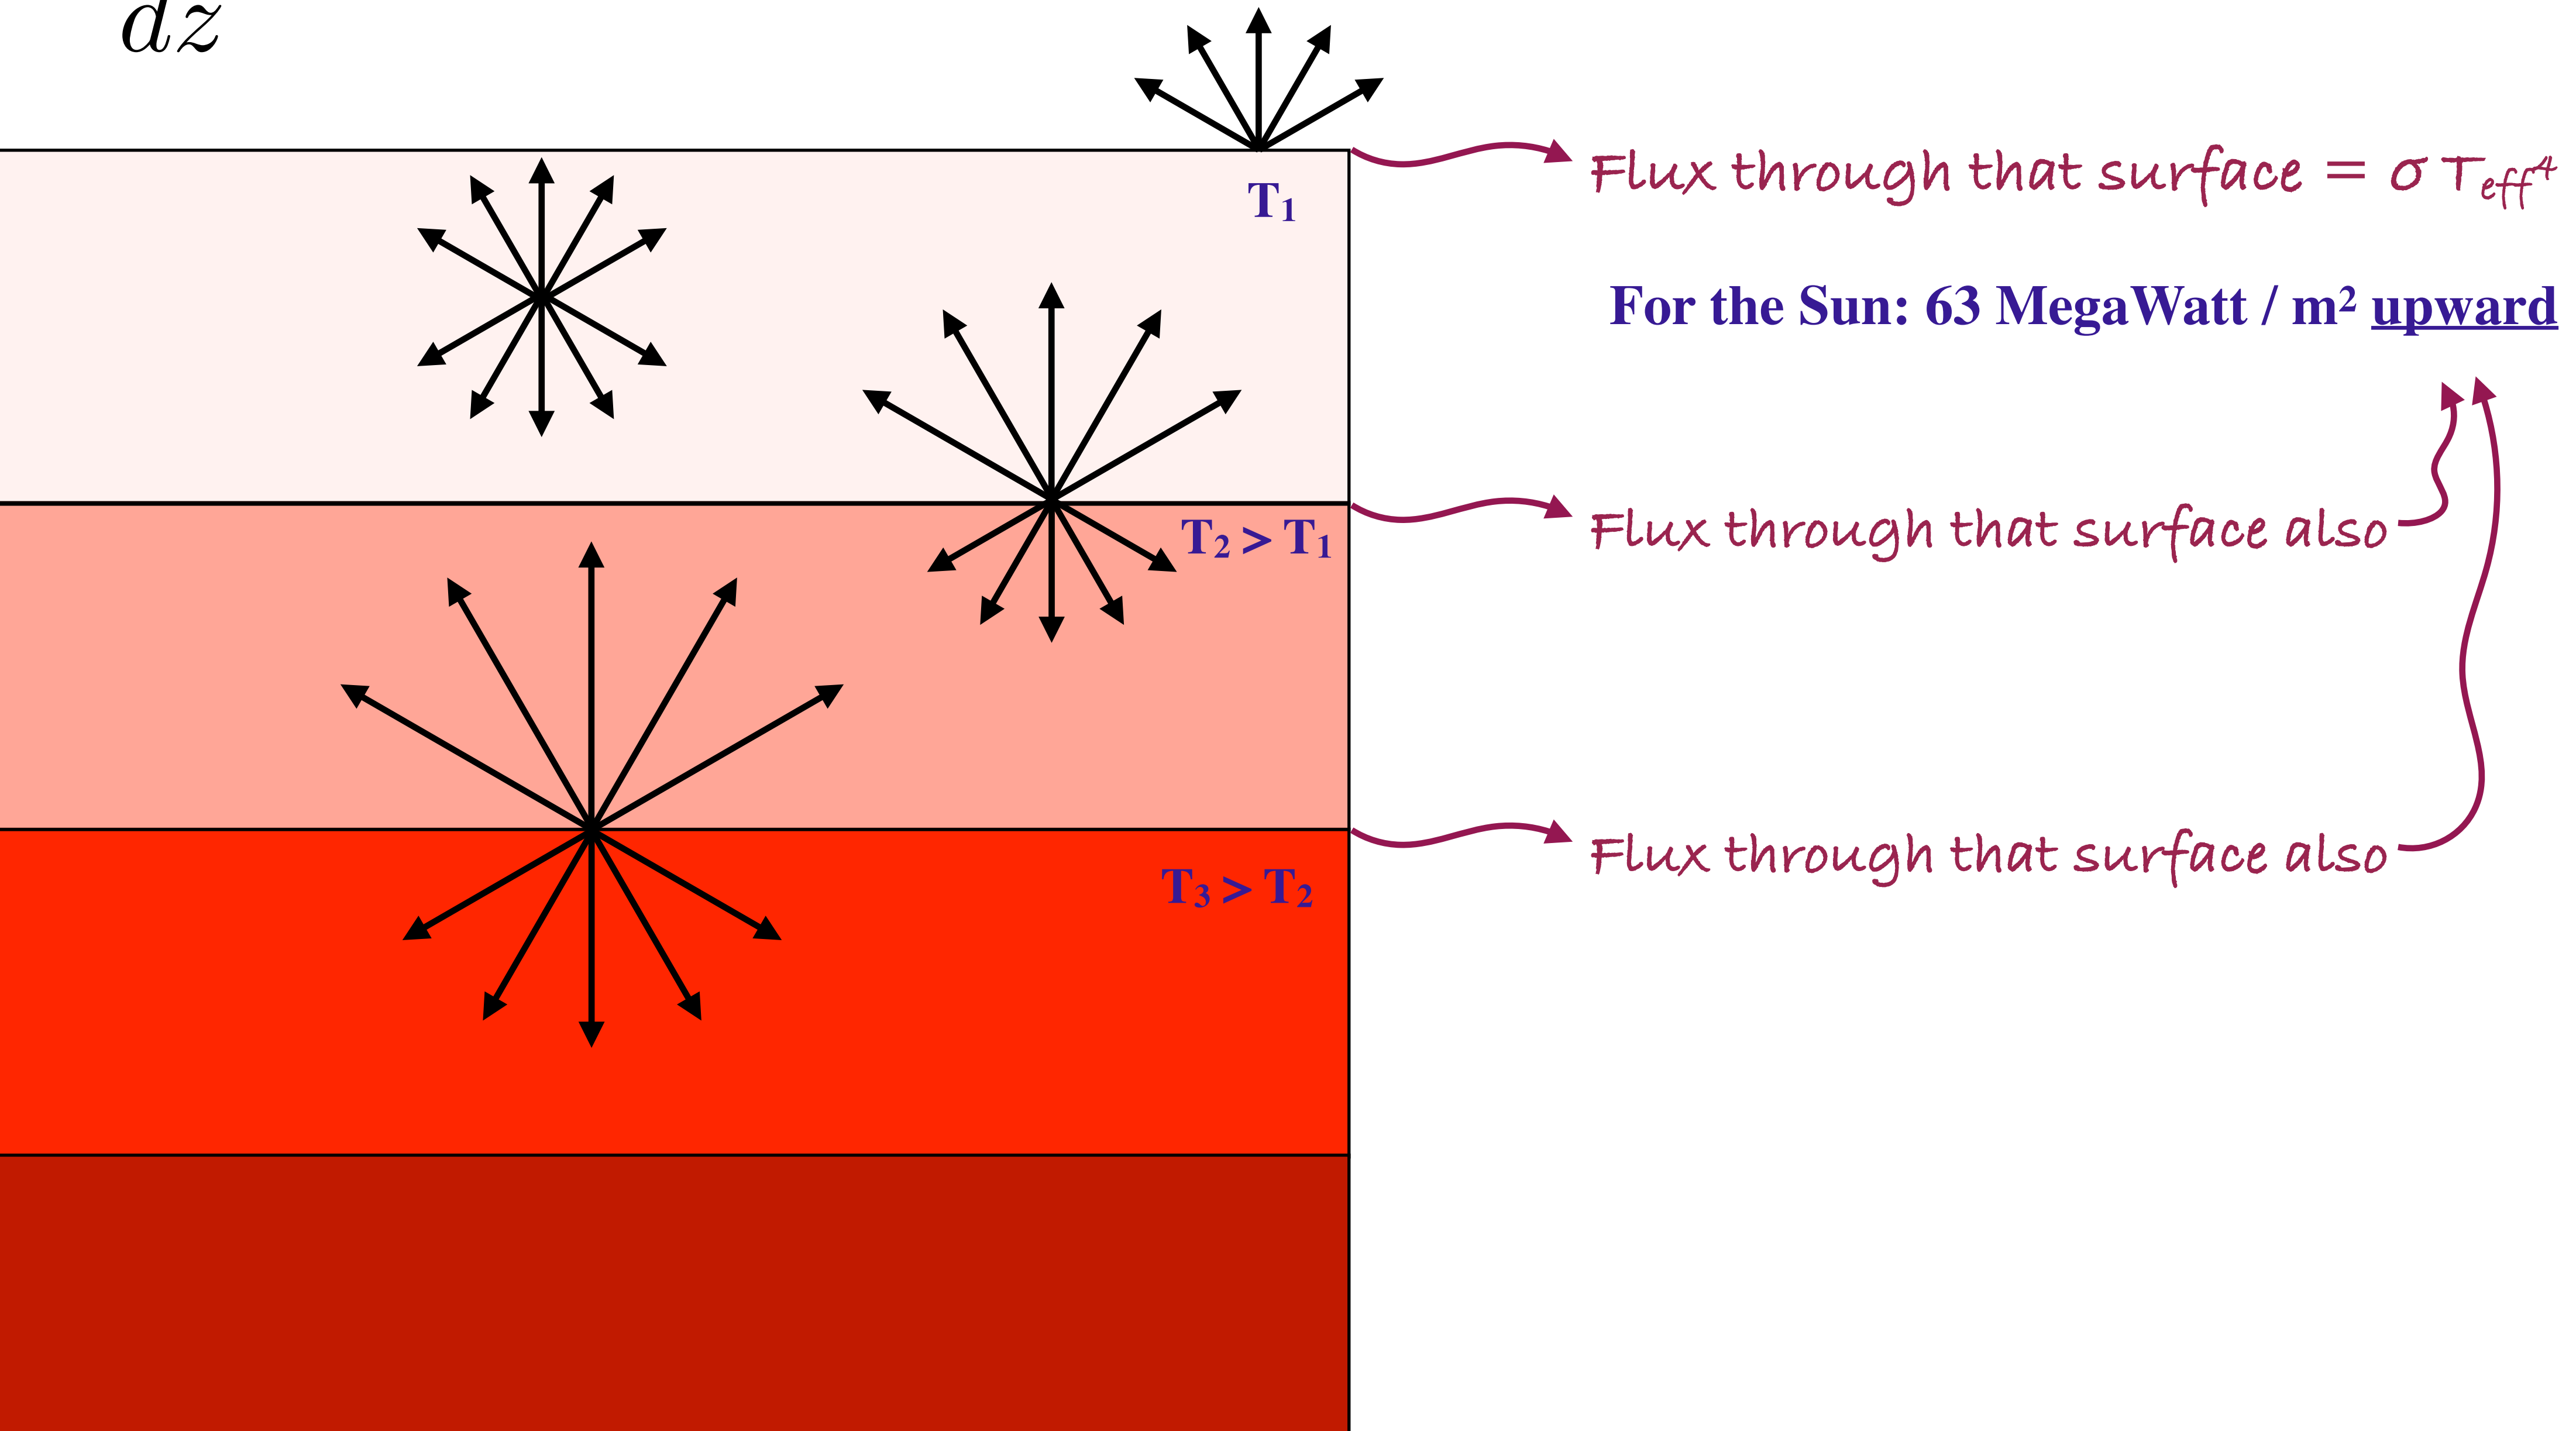

For the Sun: 63 MegaWatt / m² upward

Flux through that surface also

Flux through that surface also

$$\frac{dF}{dz} = 0$$

$$\frac{dF}{dz} = 0$$

So we need to relate the flux to source function.

Flux

General

$$F_{\lambda} = \int I_{\lambda} \cos \theta d\Omega$$

**Spherical, with azimuthal symmetry
($u = \cos \theta$)**

$$\frac{F_{\lambda}}{4\pi} = \frac{1}{2} \int_{-1}^{+1} I_{\lambda}(u) u du$$

Solution for a flat, semi-infinite atmosphere:

out

$$I(\tau_z, u > 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=\infty} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau'_z}{u}$$

in

$$I(\tau_z, u < 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=0} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau'_z}{u}$$

First a parenthesis: For the ‘surface’, the Eddington-Barbier relation

Flux

General

$$F_{\lambda} = \int I_{\lambda} \cos \theta d\Omega$$

**Spherical, with azimuthal symmetry
($u = \cos \theta$)**

$$\frac{F_{\lambda}}{4\pi} = \frac{1}{2} \int_{-1}^{+1} I_{\lambda}(u) u du$$

Solution for a flat, semi-infinite atmosphere:
out

$$I_{\text{Obs}}(u > 0) = I(\tau_z = 0, u > 0) = \int_{\tau'_z = \tau_z}^{\tau'_z = \infty} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau_z}{u}$$

Let's make the approximation that
 S increases linearly with τ_z

Intensity for a flat, semi-infinite atmosphere

Reminder

$$S(\tau'_z) = S_0 + S_1 \tau'_z$$

$$I_{\text{Obs}}(u > 0) = I(\tau_z = 0, u > 0) = \int_{\tau'_z = \tau_z}^{\tau'_z = \infty} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau'_z}{u}$$

... math here :)

$$I(\tau_z = 0, u > 0) = S_0 + S_1 u$$

$$= S(\tau_z = u)$$

So the intensity for a given u ray is equal to the value of the source function S at the layer where the vertical optical depth τ_z is equal to u

5. At home: Formal solution with source function increases linearly with optical depth

Let's assume that the density in the slab is constant, such that $\kappa\rho = 2.0$ per unit

The source function is a function of τ such that:

$$S(\tau) = S_0 + S_1 \tau$$

where $S_0 = 0.5$ intensity unit, and $S_1 = 1.3$ intensity units per optical depth unit

There is no initial intensity entering the slab so $I_o = 0$.

Prepare your code such that you can vary the values of the parameters.

Let's make the approximation that S increases linearly with τ_z

First a parenthesis: For the ‘surface’, the Eddington-Barbier relation

On the board

The surface flux is a measure of the value of the source function at an optical depth of $2/3$.

So we need to relate the flux to source function.

Flux

General

$$F_{\lambda} = \int I_{\lambda} \cos \theta d\Omega$$

Spherical, with azimuthal symmetry
($u = \cos \theta$)

$$\frac{F_{\lambda}}{4\pi} = \frac{1}{2} \int_{-1}^{+1} I_{\lambda}(u) u du$$

Solution for a flat, semi-infinite atmosphere:

out

$$I(\tau_z, u > 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=\infty} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau'_z}{u}$$

in

$$I(\tau_z, u < 0) = \int_{\tau'_z=\tau_z}^{\tau'_z=0} S(\tau'_z) e^{\frac{\tau_z - \tau'_z}{u}} \frac{d\tau'_z}{u}$$

Put the solution for $I(\tau_z, u)$ in the flux equation. On the board

So we need to relate the flux to source function.

On the board:

Step1: Separate the integral in the flux equation into two pieces

Step2: Switch the u and the τ_z integrals

Step3: Assume that the source function is isotropic (not a function of u)

Step4: Make a substitution in the 1st term for $a = (\tau'_z - \tau_z)$, and $x = 1/u$

Step5: Make a substitution in the 2nd term for $a = (\tau_z - \tau'_z)$, and $x = -1/u$

Step6: Replace the x integral for “exponential functions”

$$\frac{F_\lambda(\tau)}{4\pi} = -\frac{1}{2} \int_{\tau'=0}^{\tau} S_\lambda(\tau') E_2(\tau - \tau') d\tau' + \frac{1}{2} \int_{\tau'=\tau}^{\infty} S_\lambda(\tau') E_2(\tau' - \tau) d\tau'$$

Exponential functions [python: `scipy.special.expn(n, a)`]

$$E_n(a) = \int_1^\infty \frac{e^{-ax}}{x^n} dx$$

$$E_n(a = 0) = \frac{1}{n-1}$$

$$\frac{dE_n(a)}{da} = -E_{n-1}(a)$$

$$nE_{n+1}(a) = e^{-a} - aE_n(a)$$

$$\frac{F_\lambda(\tau)}{4\pi} = -\frac{1}{2} \int_{\tau'=0}^{\tau} S_\lambda(\tau') E_2(\tau - \tau') d\tau' + \frac{1}{2} \int_{\tau'=\tau}^{\infty} S_\lambda(\tau') E_2(\tau' - \tau) d\tau'$$

$$\frac{F_\lambda(\tau)}{4\pi} = -\frac{1}{2} \int_{\tau'=0}^{\tau} S_\lambda(\tau') E_2(\tau - \tau') d\tau' + \frac{1}{2} \int_{\tau'=\tau}^{\infty} S_\lambda(\tau') E_2(\tau' - \tau) d\tau'$$

$$\frac{F_\lambda(\tau)}{4\pi} = -\frac{1}{2} \int_{\tau'=0}^{\tau} S_\lambda(\tau') E_2(\tau - \tau') d\tau' + \frac{1}{2} \int_{\tau'=\tau}^{\infty} S_\lambda(\tau') E_2(\tau' - \tau) d\tau'$$

1	$\int_0^\infty F(\lambda, \tau_\lambda) d\lambda = \sigma T_{\text{eff}}^4$	$F(\lambda, \tau_\lambda)$ T_{eff}
